

SquareApplet

Code:

```
import java.applet.Applet;
import java.awt.*;
import java.awt.event.*;

public class SquareApplet extends Applet implements ActionListener {

    Label numberLabel;
    Label resultLabel;
    TextField numberField;
    Button squareButton;

    public void init() {

        // Create AWT controls
        numberLabel = new Label("Enter a number:");
        numberField = new TextField(10);
        squareButton = new Button("Find Square");
        resultLabel = new Label("Square = ");

        // Set layout
        setLayout(new FlowLayout());

        // Add controls
        add(numberLabel);
        add(numberField);
        add(squareButton);
        add(resultLabel);

        // Register ActionListener
        squareButton.addActionListener(this);
    }

    // Handle button click
    public void actionPerformed(ActionEvent e) {

        int number = Integer.parseInt(numberField.getText());
        int square = number * number;

        resultLabel.setText("Square = " + square);
    }
}
```

HTML:

```
<html>
<head>
    <title>Square Calculator</title>
</head>

<body>
```

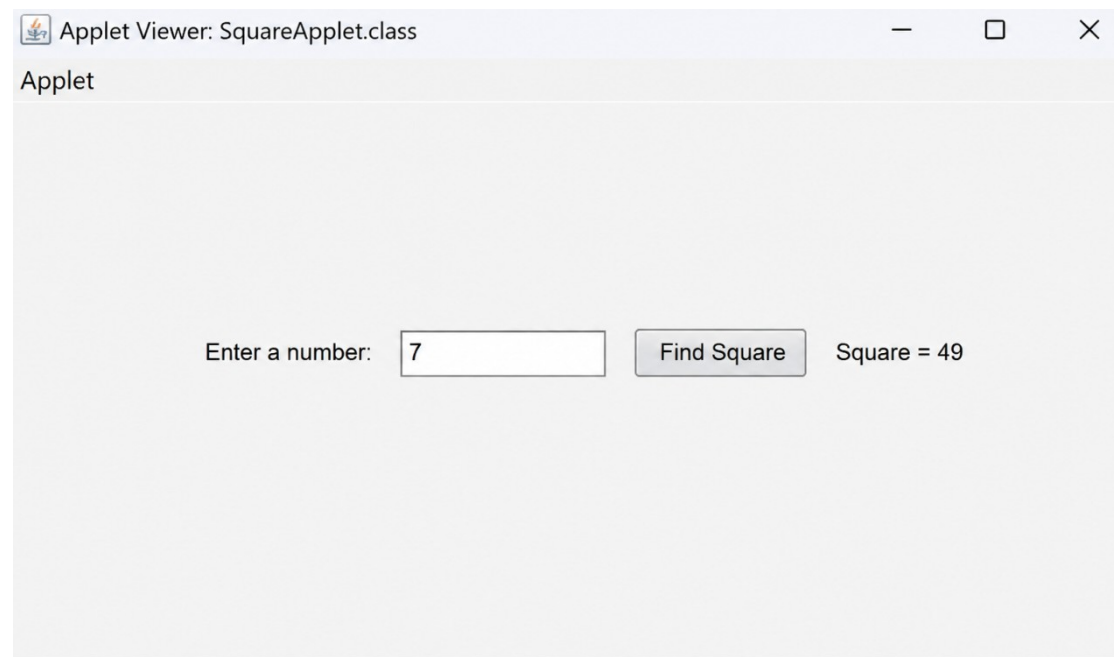

```
<h2>Square Calculator Applet</h2>
```

```
<applet code="SquareApplet.class"  
  width="500"  
  height="200">  
</applet>
```

```
</body>
```

```
</html>
```

OUTPUT:

Applet started.
